DEF MODULE CLEANING KIT

Introducing our comprehensive DEF Module Cleaning Kits: designed to effectively clean and rinse crystallized DEF residues from key components, including the dosing module, injector line, and injector.

Each kit provides targeted tools to service specific areas within the anti-pollution system, while essential cleaning actions are seamlessly activated through your diagnostic tool.

JALTEST DEF CLEANING VS. ADDITIVES

The Jaltest DEF Cleaning Module directly removes existing substances from the pump unit, injector, and metering circuit, avoiding the risk of chemical interference that can lead to poor DEF quality.

The additive from some manufacturers, designed to mix with DEF, dissolves crystallized residues and sediments in the tank and hydraulic lines, making it a great option for preventive maintenance.

For more information, call your distributor and ask for your **Jaltest DEF Cleaning Kit**
